SUMMARY

Unity developer and technical artist with 3+ years building shipped games and real-time applications across mobile, WebGL and AR, with depth in gameplay architecture, animation systems and custom HLSL shader programming. Production experience taking titles from GDD through Play Store release. Most recently owned the entire Unity client of a 3D character-driven mobile product, building its behaviour, animation, rendering and tooling systems end-to-end.

TECHNICAL SKILLS

Languages: C#, C/C++, HLSL, GML, Python, JavaScript, SQL

Engines and Graphics: Unity 3D/2D (URP), GameMaker Studio, custom HLSL shaders, Shader Graph, OpenGL 3.3, WebGL, real-time VFX, planar reflections, procedural generation, profiling and optimisation

Gameplay Systems: Behaviour and state architecture, animation systems and state machines, character controllers, Rigidbody physics, AI pathfinding, Netcode for GameObjects, custom editor tooling

Pipeline and Tools: Android and iOS builds, Play Store submission, IronSource ad mediation, native plugins (Objective-C, Java/JNI), cross-device QA, Blender, Aseprite, Figma, pixel art, Git/GitHub, JIRA, Asana

EXPERIENCE

Unity Developer | Boop | Remote/Contract

Jun 2026 - Sep 2026

- Took over sole ownership of the Unity client for a 3D companion product after the other Unity developers departed, delivering all gameplay, animation, rendering and tooling work through to a near-release build.
- Built a data-driven behaviour system: 27 ScriptableObject behaviours selected from live context by requirement matching and a priority ladder, with recency-weighted random selection so ambient behaviour reads as spontaneous, not looping.
- Implemented a 20-step execution interpreter composing performances from reusable steps - anchor navigation, animation playback, gesture-scrubbed clips, rig displacement, camera control - so new behaviours could be authored in the Inspector without code, alongside 11 custom editor tools.
- Solved animations authored flush against furniture by displacing the collider-free visual rig to an interaction anchor while the physics body held its legal position; refactored movement onto a single-writer motor, fixing a Rigidbody/transform desync causing drift.
- Built state-driven animation variant swapping, spring-bone secondary motion and a frame-accurate audio cue system locked to the animator playhead; shipped three URP quality tiers with automatic device-tier detection and a zero-allocation CPU/GPU profiling overlay.

Lead Game Developer | TONIZTOZ | Remote

Mar 2025 - Present

- Sole senior developer leading a five-person cross-disciplinary team on an original 2D pixel-art horror game rooted in Asian folklore, owning it from storyline, storyboard and GDD through active development while mentoring juniors on Unity, Aseprite and asset workflows.
- Architected the full project groundwork and core systems end-to-end, including the player animation pipeline and player class architecture.
- Drove all visual development through custom HLSL shader programming: 2D volumetric fog, a pixel-art horror lighting pipeline, and bespoke ghost/demon shaders with distortion and translucency.

Unity Developer Intern | Pythrust Technologies | Gurugram, India

Oct 2025 - Jan 2026

- Developed 17+ complete mini-games from scratch inside 2MinWin by MINWIN Digital Studios as part of a five-person team, implementing multiplayer, VFX, UI and SFX end-to-end for each and working with UI and sound design to keep proposed designs replicable in engine.
- Integrated the IronSource ad mediation SDK alongside analytics and backend services; ran cross-device regression testing and tracked delivery through Asana.

Independent Contractor | Remote/Contract

2024 - Present

- Delivered 15+ AR Unity projects including real-time tracking systems, indoor navigation using 3D spatial scans, and interactive environments. 
- Built and shipped four real-time casual casino games (Mines, Roulette, Crash, Teen Patti) with backend API integration, RTP mathematical models, live wallet systems and retention-focused gameplay loops. 

PROJECTS

Chalo Yaar! - 3D Multiplayer Travel Survival Game

Jan 2026 - May 2026

- Built a Unity survival prototype with first-person exploration, a drivable campervan hub, wildlife photography progression, inventory and survival stat systems, on a modular multiplayer architecture using Netcode for GameObjects.
- Engineered custom HLSL rendering systems: a procedural water shader with Worley Noise caustics, volumetric fog from 3D noise, and GPU foliage wind simulation via vertex displacement.
- Reduced draw call batches from 130,000+ to under 30,000 and raised sustained framerate from 15 fps to 50+ fps through shadow caster reduction, LOD tuning and volumetric fog masking foliage culling.

Lucius: The Endless Maze Runner | SlenderAR: AR Horror Survival

2024 - 2025

- Lucius: a 3D horror maze runner using a backtracking algorithm for procedural level generation, with enemy AI pathfinding that adapts dynamically to player position through generated mazes. 
- SlenderAR: recreated the Slenderman experience in AR with Unity and AR Foundation, with portal-based entry, player-tracking AI and dynamic audio. Both launched on [Itch.io](#). 

EDUCATION

B.Tech Computer Science and Engineering (spz. Gaming and Graphics) | UPES, Dehradun | CGPA 7.78

2022 - 2026
